Eco-comfort technology makes Mitsubishi Electric Heating and Cooling systems greener and more energy efficient.

Mitsubishi Electric is at the forefront of the green movement -- with heating and cooling systems that are good for the planet as well as good for creating precise temperature control -- even in areas of the home where nothing else seemed to work.

There is a \$230 billion market place for consumers who want to buy green products -- and this market is expected to triple in the next decade. Mitsubishi Electric taps into this consumer trend with some innovations no one else can offer.

Using advanced eco-comfort technology, we have designed systems that are dramatically more energy efficient than traditional methods of heating and cooling. And unlike traditional systems, our INVERTER Technology maintains the desired room temperature without switching on and off.

In addition to our smart energy usage, our systems use eco-friendly refrigerant and are built from 84% recyclable material.

Thanks to these latest advances, we have eight new Energy Star rated systems and seven new systems that qualify for the federal tax credit, more than any other ductless manufacturer.

As a remodeler, this means you can offer your customers greater efficiency, ultimate comfort and tax credits of up to \$1500.
